Shaping the future of animal health

YOUR CAT IS A CARNIVORE: THEIR DIET MUST RESPECT THEIR NATURE

Cats are carnivorous animals.

In the wild, **they feed mainly on meat in the form of prey**. Cats naturally prefer a diet low in carbohydrate and high in protein. And because nature knows what's best, this type of diet also has the most nutritional benefits.

So why give them cereals...?

Lots of cat foods contain significant amounts of cereals and starch. **Excess starch results in fat storage, therefore obesity**. It can also cause digestive problems because a cat's body does not digest it well.

Cats require a balanced diet to stay healthy

Giving your cat an unbalanced diet can cause **various health problems**, such as obesity, urinary stones and diabetes, all common and often caused by a poor diet.

Conversely, feeding your cat a diet that meets its carnivore needs can help **it remain healthy for longer!**

Are you giving your cat **all the protein it needs?**

Optimum requirement: 26 g a day[1]

Other foods

8% less than the optimum requirement[1]

VETERINARY HPM®
Adult neutered cat

23% more than the optimum requirement[1]

1. Amount of protein in one ration of dry food for a 5 kg adult neutered cat (ration and amount of protein based on the energy density of the food calculated using modified Atwater factors and according to label information). Comparison carried out in January 2018 in France based on a selection of physiological dry foods for adult neutered cats
2. Amount of protein in one ration of dry food for a 5 kg adult neutered cat (ration and amount of protein based on the energy density of the food calculated using modified Atwater factors and according to label information). Comparison carried out in April 2017 in France based on a selection of physiological dry foods for adult neutered cats sold in pet stores.

VETERINARY HPM® RESPECTS THEIR CARNIVOROUS NATURE AND HELPS MAINTAIN THEIR HEALTH

NUTRITION FOR CARNIVORES

VETERINARY HPM® has a high protein and low carbohydrate nutritional profile and contains an innovative selection of healthy ingredients, making it the ideal everyday choice for taking care of your cat.

⊕ protein
of which 90% is protein of animal origin: pork, poultry

⊖ carbohydrate
and cereals: **no** wheat, corn, gluten, soya

MAINTAINING GOOD HEALTH

By changing the way you feed your cat, you can help it stay fit and healthy.

Weight control

- Protein digestion consumes energy.
- Protein increases satiety.
- Protein promotes muscle mass.

This type of diet is particularly suitable for neutered and sedentary cats[3].

Urinary and renal health

- Protein promotes good urinary health.

High levels of protein and the addition of cynarine promote good urinary health by stimulating water consumption and diluting urine.

Skin and coat condition

Immune support

Digestive tolerance

3. Nguyen P, *et al.* High protein intake a ects lean body mass but not energy expenditure in nonobese neutered cats. J Nutr 2004; 1084S-2086S.

VETERINARY HPM®: QUALITY ABOVE ALL

TO FEED YOUR CAT, WE COMMIT TO THE STRICTEST QUALITY STANDARDS:

Foods in the VETERINARY HPM® range are **produced at our plant** in Vauvert, near Montpellier.

Foods in the VETERINARY HPM® range contain **no added colouring or artificial flavourings** and are **gluten-free**.

Foods in the VETERINARY HPM® range are made from high-quality **animal protein**.

The manufacturing process used to produce foods in the VETERINARY HPM® range **preserves the nutritional qualities and palatability of ingredients:**

- Ingredients of animal origin (as well as other ingredients) are cooked at a controlled temperature (minimum 90 °C at the centre), to preserve their nutritional qualities and guarantee optimum digestibility;
- Dry food is coated at room temperature with animal fats, making it highly palatable;
- Fragile functional ingredients are incorporated at the end of the process to preserve their activity.

PRACTICAL TIPS FOR FEEDING YOUR CAT

WANT TO CHANGE THEIR DIET? TAKE THINGS SLOWLY

It is essential to **introduce new food gradually**, mixing it with the previous food **over a period of one to three weeks**, depending on how well the cat's body adapts.

Any digestive disorders observed during this transition phase are perfectly normal, because the animal's digestive system needs time to get used to its new food.

STEP 1: 2 to 7 days
Mix 25% VETERINARY HPM® food and 75% previous food

STEP 2: 2 to 7 days
Mix 50% VETERINARY HPM® food and 50% previous food

STEP 3: 2 to 7 days
Mix 75% VETERINARY HPM® food and 25% previous food

STEP 4:
Give 100% VETERINARY HPM® food

EVERY DAY

1 Respect the daily ration recommended by your veterinary surgeon

These amounts will fully cover your pet's daily needs.
If you feed more, or give extra food or treats, your cat will gain weight.
Note: *a 500 g weight gain in a cat is the equivalent of 10 kg in a human!*

2 Split the distribution of dry food

Your cat is a natural "nibbler", so it is best **to split the daily ration** into several small meals.

3 Ensure your cat has permanent access to one or more sources of water

It is important to always **leave fresh, clean water out for your cat**.
With VETERINARY HPM®, your cat may drink more than usual because protein encourages drinking.

VETERINARY HPM®: FOR ALL CATS, INCLUDING YOUR OWN

FOR HARMONIOUS GROWTH

• **Before neutering**

Baby pre neutered cat

400 g, 1.5 kg and 3 kg bags.

- For kittens, from weaning to neutering, before 12 months of age.
- For pregnant or lactating cats.

• **After neutering**

Junior neutered cat

400 g, 1.5 kg and 3 kg bags.

- For kittens, from neutering up to 12 months of age.

WHY MUST I CHANGE MY CAT'S DIET AFTER NEUTERING?

Neutering has a huge impact on a cat's body.

Once neutered, a cat tends to eat more, whereas **its energy requirements are reduced by 30%**[1].

Risk of weight gain **is tripled** after neutering[2].

In just 2 months, a 4 kg cat **can gain up to 2 kg**, the equivalent of 35 kg in a 70 kg man[2].

Male cats gain **twice as much** weight as female cats[2].

Your cat's health and well-being depend partly on maintaining a healthy weight.

It is therefore essential to adapt its diet to avoid any weight gain, while at the same time covering its growth requirements if it has not yet reached its adult size. **The Junior Cat food is formulated specifically to meet this double challenge.**

TO SUPPORT THEM THROUGH ADULTHOOD AND INTO OLD AGE

Adult neutered cat

400 kg, 1.5 kg, 3 kg, 7 kg and 12 kg bags.

- For adult neutered cats, between 1 and 10 years of age.

- For adult neutered or entire cats, between 1 and 10 years of age.

Adult neutered & entire cat with salmon

1.5 kg, 3 kg and 7 kg bags.

Senior neutered cat

400 kg, 1.5 kg, 3 kg and 7 kg bags.

- For neutered cats over 10 years of age.
